

EXITSENTRY

Photographs of Wrong-Way Motion Events

The following photographs were captured by Cernium's ExitSentry System installed in the exit lane of a major U.S. Airport. Each set of two photos, one from the "detection" camera (left side) and one from the "watcher" camera (right side), shows a wrong-way motion event in the exit lane. The "detection" camera tracks each object with a "box" and displays a "tail" representing recent frame history. The "tail" and "box" are **green** if the object is proceeding correctly and **red** once wrong-way motion has been detected.
